Abstract

This study focuses on the factors that predict teachers' job satisfaction. Twenty-seven out of 206 studies were examined based on various criteria. The studies were synthesised in accordance with systematic review methods. The studies that investigated teachers' job satisfaction and were conducted in the Turkish context were retrieved from WOS, ERIC, SCOPUS and ULAKBİM databases, and then the selected studies were analysed. In the analyses, themes and subthemes related to the predictive variables were formed. As a result, three themes that positively predicted teachers' job satisfaction were highlighted. These themes were administrators' behaviours, individual variables and organisational variables. The results showed that a strong school culture in which support, trust, justice and communication are established is a decisive factor in ensuring teachers' job satisfaction. Additionally, teachers' beliefs in their professional competence and having psychological well-being were found to be important factors for their job satisfaction.

Keywords: Teachers' job satisfaction, systematic review, factors affecting job satisfaction, school culture

1. Introduction

Job satisfaction is of importance for employees' happiness and the organisation's effectiveness and efficiency (Luthans, 2010). In the literature, job satisfaction is defined as the content and happiness (Davis & Bordieri, 1988; Hackman & Oldham, 1976), emotional states that please individuals (Locke, 1969), employees' attitudes towards their professional satisfaction (Spector, 1997) and the feeling of success achieved in their job (Kaliski, 2007) which are experienced as a result of gaining job experience and fulfilling their duties. Besides, job satisfaction is a compound of psychological, physiological and environmental conditions that ensure satisfaction (Aziri, 2011; Hoppock, 1935). It can be argued that there are similarities between the definitions of job satisfaction that can be defined as positive feelings about one's job or duties.

Teachers' job satisfaction is emotional reactions to their duties or instructional roles (Skaalvik & Skaalvik, 2011). In most of the studies on teachers' job satisfaction, the motivating and hygiene factors in Herzberg's (1959) dual-factor motivation theory are commonly used. Motivating factors include intrinsic motivators such as characteristics of the job, success, recognition, taking responsibility and creating opportunities. Hygiene factors that cause dissatisfaction include employees' working conditions, and organisational supervision and interpersonal relationships (Bogler, 2001). In this respect, Dinham and Scott (2000) describe the sources of job satisfaction and dissatisfaction as (a) teachers' intrinsic rewards, (b) school-based factors, and (c) out-of-school factors. Teachers' intrinsic rewards are related to their
working with students and following students' development. School-based factors include the
relationships between colleagues, parents and school leaders, and oppressive and destructive
student behaviours. Out-of-school factors contain those such as changes in education and the
evaluation of schools by independent bodies (Skaalvik & Skaalvik, 2011).

The concept of job satisfaction that falls within organisational psychology and sociology
(Arnold, Cooper & Robertson, 1998; Matiaske & Grözinger, 2011) is based on the works
“Management and the Worker” by Roethlisberger and Diekson, and “Job Satisfaction” by
Hoppeok that were published in 1930s (Locke, 1969). Researchers suggest that global and
mixed approaches are influential on the measurement of job satisfaction. The global approach
refers to individuals' general emotional reactions to their job, while the mixed approach is
related to individuals' and their colleagues' working conditions, the nature of the job,
organisational politics and processes, and attitudes towards pays and supervision (Bruck, Allen
& Spector, 2002; Spector, 1997). On the other hand, theories of content and needs, process
theories and situational theories have been influential on the theoretical development of job
satisfaction (Green, 2000). It can thus be inferred that different theories and models laid the
foundations for the theoretical bases of job satisfaction.

In terms of the theories of content and needs, job satisfaction was based on Maslow's (1943)
Hierarchy of Needs and Herzberg’s (1966) Dual-Factor Theory. Needs theories mostly focus
on personal needs that match professional satisfaction (e.g. eating, drinking and housing) or
values (e.g. respect, recognition and success). Content theories concentrate on the factors that
initiate, direct, maintain and halt human behaviours (Amos, Pearson & Ristaw, 2008). Process
theories are fed by theories including Adams’s (1965) “Equity Theory” and Bandura’s (1977)
“Social Learning Theory”. These theories aim at explaining the relationships between values,
needs and expectations that constitute motivation and job satisfaction (Amos et al., 2008;
Green, 2000). Process theories emphasise cognitive thinking processes, and employees'
motivation and satisfaction (Ololube, 2006). They determine individuals' perceptions in work
environments and the way in which they interpret and understand events (Kerschen, Armstrong
& Hillman, 2006). Consequently, the theoretical bases of job satisfaction spread across a wide
area in the literature.

In addition to the theoretical bases mentioned above, situational models that form the third
theoretical framework for job satisfaction are associated with Locke’s (1976) Range of Affect
Theory, and Hackman and Oldham’s (1976) Job Characteristics Model. These theories focus
on job characteristics (e.g. the nature and quality of the job), and organisational characteristics
(the organisations' basis leadership and promotion criteria) (Glisson & Durick, 1988).
Situational models are determined by situational characteristics and events. Employees call
upon situational characteristics while evaluating the working conditions of the organisation and
the wage conditions before joining the organisation. Situational events include positive (e.g.
respecting employees and rewards like praises) and negative (e.g. disrespect among colleagues
and complex work processes) events that employees encounter when they start the job
(Glassman & McAfee, 1992). Based on these models, it can be argued that various
characteristics of individuals and organisations are effective in promoting job satisfaction.

The antecedents and consequences of job satisfaction were examined in international studies
in the field of education. In these studies, job satisfaction was explored with variables such as
motivation, self-efficacy perception, working conditions, stress and school culture (e.g.
Klassen, Usher & Bong, 2010; Koustelios, 2001; Ma & MacMillan, 1999; Skaalvik &
Skaalvik, 2011; Skaalvik & Skaalvik, 2009; Somech & Drach-Zahavy, 2000; Taylor &
Tashakkori, 1995; Van Houtte, 2006). In the Turkish context, many studies that examined the
relationship between job satisfaction and different individual or organisational characteristics
have been conducted since 2000s. In Turkey, job satisfaction was often studied with relation to the concepts of leadership, self-efficacy, administrative behaviours, job performance and commitment (e.g. Çevik, 2017; Güngör, 2016; Okçu & Çetin, 2017; Şeşen, Tabak & Arlı, 2017; Taş, 2017; Türkoğlu, Cansoy & Parlar, 2017; Uzun & Özdem, 2017). As can be inferred from these studies, job satisfaction is seen as an important variable in schools.

Although there are studies on variables that can be antecedents to job satisfaction across the world, no studies have been encountered which examine and interpret the findings regarding the variables that have potential effects on job satisfaction in the Turkish context. In this regard, this study sets out to fill a gap and extend the literature in this sense. Additionally, reporting the common findings in different studies can provide practitioners certain practical results in making evidence-based policies and improving teachers' job satisfaction. Presenting a synthesis of the data provided by evidence-based studies can be of significance for educational stakeholders. By means of such results, teachers' practising their profession more contentedly can be facilitated at the organisational level. As for teachers, such information can raise their awareness. Moreover, researchers can make certain decisions regarding the variable that they can use in their studies by seeing the results of different studies as a whole. Consequently, this study aimed at revealing the factors that affect teachers' job satisfaction in Turkey.

2. Method

The factors that predict teachers' job satisfaction were examined in this study. Systematic review refers to synthesising the findings of many different studies in a way that is clear, transparent, replicable and accountable (Oakley, 2002). Systematic review or examination is a method of defining and synthesising research findings regarding a certain topic. In systematic reviews, empirical findings are brought together based on predetermined criteria to answer a research question. In this methodology, clear and systematic methods are used to minimize researchers' subjective judgements. Systematic review studies enable researchers to make a synthesis of the studies on a topic and determine the areas that need to be explored, and practitioners and policy-makers to take measures for possible or existing problems (Higgins & Green, 2011). Systematic review is commonly used as a methodology in health sciences, and there have been discussions about its use in educational sciences. Educational researchers view systematic review studies as significant. This is because such studies facilitate reaching research findings as a whole (Clegg, 2005; Hammersley, 2008).

2.1. Selection of studies

Systematic reviews consist of sections that are search strategy, inclusion criteria, scanning, gathering and defining the data, demonstrating the quality of the studies included, and synthesis of the findings, respectively (Karaçam, 2014). In the first step, the selection criteria and databases were determined. Then, the criteria for including the studies in the analysis and the scanning process were followed. In the last step, the quality of the studies was examined with a synthesis of their findings.

In accordance with the research aim, studies were searched in the databases including Web of Science, ERIC, SCOPUS and ULAKBIM. In the data gathering process, the query “teachers' job satisfaction” was searched in the databases concerned. These searches were done in both Turkish and English.

At this point, the following criteria were determined by the researchers, which was also based on expert opinion: (i) being a full-text empirical paper in the field of education, (ii) being published in national and international journals between 2000-2017, (iii) being an original study, (iv) focusing on teacher job satisfaction, (v) reporting findings related to the research aim, (vi) being conducted in educational institutions, (vii) being conducted in schools in the
Turkish context, (viii) being quantitative and relational studies, (xi) clearly describing elements such as sample, method and measurement tools and providing statistically necessary information accurately. In this sense, the selection was limited to studies found in databases that are accepted as reputable in science and published in refereed journals. Besides, the time frame was set as between 2000-2017 because the empirical studies on teachers' job satisfaction became widespread in the national literature during this period.

A total of 206 studies were retrieved by searching the key word “teachers' job satisfaction” in the databases including Web of Science, ERIC, SCOPUS and ULAKBİM. Then, 161 studies that did not predict job satisfaction were excluded from the evaluation, and 18 recurring studies were also eliminated. Lastly, the remaining 27 studies were analysed in detail. An evaluation form was developed in accordance with the criteria for the selection of studies. The studies were retrieved by the researchers as they used this form. The full-text studies were coded as S1, S2, S3,...S27, and stored in the computer environment. The authors, topics, methods and findings of the studies were divided into categories by using Microsoft Office Excel.

The quality of the 27 articles were evaluated based on EPPI-Centre (2018), and the framework for assessing the weight of evidence proposed by Gough, Oliver and Thomas (2017). Evaluating the methodological quality, methodological relevance and topic relevance of studies as a whole demonstrates the weight of evidence. In this regard, the design of the studies can make them stronger in terms of evidence. Besides, the methodology and the topic of the articles being relevant also contribute to this aspect. Both researchers of the present study prepared a quality check-list and evaluated the studies by rating them from 1 to 4 based on quality. In case of a disagreement, the opinion of an expert was obtained. The studies that did not meet the necessary criteria in the quality check-list were excluded from the analysis. For example, the studies whose methodologies were not written well, and reliability and validity values were not provided were excluded.

In this step, the studies were summarised and the themes were formed in accordance with the research aims. The summaries under each theme were read and evaluated to reach primary themes. The studies were read and evaluated independently by the two researchers. Lastly, the studies evaluated by the researchers were combined in a single form. The studies included in the analysis are presented in Table 1.

</table>
Demirtaş & Alanoğlu (2015)  
Quantitative  
n=379  
Teachers' participation in decisions at school predicts their job satisfaction ($R^2=.41$). Job satisfaction have a positive and significant relationship with participation in educational decisions ($r=.36, p < .05$) and participation to administrative decisions ($r=.34, p < .05$).

Ilgaz, Parylo & Sungu (2015)  
Quantitative  
n=600  
School principals' instructional supervision behaviours that feature improving instruction and teachers, and guiding them by visiting classrooms predict different dimensions of teachers' job satisfaction. Instructional supervision behaviours are related to teachers' administrative satisfaction ($r=.65, p < .05$) and explain administrative satisfaction ($R^2=.42$). Instructional supervision behaviours are related to the satisfaction related to working life ($r=.42, p < .05$) and explain the satisfaction related to working life ($R^2=.18$). Instructional supervision behaviours are related to, and explain, self-improvement and safety in terms of economic issues ($r=.35, p < .05$), ($R^2=.12$). Instructional supervision behaviours predict job satisfaction as a whole.

Büyükgoze-Kavas, Duffy, Güneri & Autin (2014)  
Quantitative  
n=500  
Teachers' positive feelings that express their pleasure from life is related to job satisfaction ($r=.49, p < .05$), and teachers' positive feelings predict job satisfaction ($β=.33$). Teachers' job satisfaction is related to their levels of accomplishing their goals at the work place ($r=.44, p < .05$), and these levels predict job satisfaction ($β=.25$). Teachers' job satisfaction is related to perceived organisational support ($r=.36, p < .05$), and perceived organisational support predicts job satisfaction ($β=.18$).

Büyükgoze-Kavas, Duffy, Güneri & Autin (2014)  
Quantitative  
n=500  
Teachers' job satisfaction is related to perceived organisational support ($r=.36, p < .05$), and job satisfaction is predicted ($β=.18$).

Cerit (2014)  
Quantitative  
n=304  
Organisational collectivism that emphasises thinking about others in the organisation, being helpful and collaboration is related to teachers' job satisfaction ($r=.73, p < .05$) and the perception of organisational collectivism among teachers positively predicts their job satisfaction ($β=.69$).

Elma (2013)  
Quantitative  
n=686  
Operational justice that refers to the fair distribution of organisational resources is related to job satisfaction ($r=.63, p < .05$), and it predicts teachers' job satisfaction ($β=.34$). Interactional justice that refers to employees' respect and trust to each other is related to job satisfaction ($r=.64, p < .05$), and it also predicts job satisfaction ($β=.29$).

Karakuş & Çankaya (2012)  
Quantitative  
n=237  
Communication social relationships, reputation damage and psychological violence that teachers are exposed to are related to job satisfaction ($r=-.28, p < .05$) and psychological violence is a negative predictor of job satisfaction ($β=-.23$). Teachers' burnout is related to their job satisfaction ($r=-.34, p < .05$) and burnout negatively predicts job satisfaction ($β=-.28$).

Gümüş, Hamarat, Çolak & Duran (2012)  
Quantitative  
n=238  
Organisational identification that highlights individuals' feeling of belonging to the organisation they work in predicts teachers' job satisfaction. Identification with school ($r=.37, p < .05$) and professional identification ($r=.30, p < .05$) are related to job satisfaction.

Yılmaz & Altınkurt (2012)  
Quantitative  
n=249  
School administrators' use of rewards significantly and positively predicts teachers job satisfaction ($β=.29$).

3. Findings

In the studies, three themes were revealed which significantly predicted teachers' job satisfaction. These themes are as follows: School administrators' administrative behaviours, individual variables and organisational variables. In this section, these primary variables that predict job satisfaction were discussed by synthesising different research findings.

3.1. School principals' administrative behaviours

School principals' administrative behaviours were found to be a predictor of teachers' job satisfaction (see Table 2).

These themes are: (i) creating a collaborative environment and team spirit at school, (ii) forming a trust-based school culture, (iii) being in communication/interaction with teachers, and (vi) supporting and tolerating employees.
Creating a collaborative environment and team spirit at school:

As is seen in Table 2, there are common findings regarding school principals' behaviours predicting teachers' job satisfaction (Bektaş & Öçal, 2012; Cerit, 2009; Güngör, 2016; Korkmaz, 2007; Tan, 2006; Taş, 2017). Korkmaz (2007) found that school principals' transformational leadership behaviours positively predicted teachers' job satisfaction. Administrators' behaviours that inspire, motivate and promote common goals were related to, and predicted, teachers' job satisfaction. In another study, Cerit (2009) demonstrated that school principals' servant leadership behaviours positively predicted teachers' job satisfaction. School principals' valuing their employees, motivating, guiding and improving them, meeting their individual needs and sharing are characteristics of servant leadership. In a similar study, Taş (2017) showed that teachers' job satisfaction was positively predicted by school principals' caring and honourable behaviours. In another study, Tan (2012) found that team leadership behaviours towards resolution, collaboration, motivation and strengthening the staff positively predicted teachers' job satisfaction. Similarly, Bektaş and Öçal (2012) reported that teachers' job satisfaction was positively predicted by the leadership behaviours that encourage collaboration among teachers at school. Likewise, Güngör (2017) demonstrated that school principals' ethical leadership behaviours that feature consistency, integration and trustworthiness positively predicted teachers' job satisfaction.

Forming a trust-based school culture:

On the other hand, Elma (2013) found that the fair distribution of school resources was a positive predictor of teachers' job satisfaction. Uzun and Özdem (2017) reported that teachers' job satisfaction was predicted by school principals' behaviours of helping and appreciating teachers.

Being in communication/interaction with teachers:

Consistently, Ilgan, Parylo and Sungu (2015) observed that administrative satisfaction and satisfaction related to work life were positively predicted when school principals provided feedback towards improving instruction and teachers. Besides, Ordu (2016) showed that school principals' different thinking dispositions and being careful about these differences in practice positively predicted teachers' job satisfaction.

Supporting and tolerating employees:

On the other hand, Savaş (2012) discovered that school principals' emotional intelligence and emotional labour behaviours towards understanding teachers were important variables in predicting their job satisfaction.

Based on these findings, it can be stated that school principals' behaviours of being tolerant and managing differences at school, being fair and supporting teachers positively predict teachers' job satisfaction.

3.2. Individual variables

Certain variables the positively predicted teachers' job satisfaction were reported (see Table 3).

These themes are: (i) teachers' positive perceptions of professional competence/efficacy, and (ii) their being psychologically healthy. These characteristics can be said to be potential individual variables for enhancing job satisfaction.

Teachers' positive perceptions of professional competence/efficacy:

Teachers' perceptions of professional competence, well-being and life satisfaction predicted their job satisfaction (Buluç & Demir, 2015; Büyükgoze-Kavas, Duffy, Güneri & Autin 2014; Çevik, 2017; Koç, Yazıcıoğlu & Hatipoğlu, 2009; Sen, Tabak & Arli, 2016; Türkoğlu, Cansoy & Parlar, 2017). Buluç and Demir (2015) found that teachers' self-evaluation was a positive predictor of their job satisfaction. In a similar study, Çevik (2017) indicated that teacher self-efficacy perceptions predicted job satisfaction, while Türkoğlu, Cansoy and Parlar (2017) demonstrated that teachers' self-efficacy perception regarding student participation was a strong predictor of their job satisfaction. In a way that supports these findings, Koç, Yazıcıoğlu and Hatipoğlu (2009) showed that teachers' job satisfaction was positively
predicted by their perceptions of competence for achieving educational goals. Similarly, Büyükoğlu-Kavas, Duffy, Güneri and Autin (2014) found that teachers' perceptions of competence for achieving educational goals positively predicted job satisfaction, and Sesen, Tabak and Arlı (2016) demonstrated that teachers' behaviours related to job quality and their monitoring of themselves related to the job positively predicted their job satisfaction.

Teachers’ being psychologically healthy:

Teachers' positive psychological perceptions are important for job satisfaction. Çevik (2017) showed that self-respect that refers to individuals' forming their own identity and valuing themselves, and life satisfaction that refers to positive life perceptions positively predicted teachers' job satisfaction. Likewise, Büyükoğlu-Kavas, Duffy, Güneri and Autin (2014) reported that teachers' positive feelings of pleasure from life positively predicted teachers' job satisfaction. Besides, Sesen, Tabak and Arlı (2016) found that teachers' job satisfaction was positively predicted by individuals' performing autonomous and unique behaviours related to their job.

3.3. Organisational variables

Some variables at the organisational level were found to positively predict teachers' job satisfaction.

These themes are: (i) perceived support, respect to ideas and values, (ii) caring about ideas and individual values, (iii) psychological mobbing.

Certain variables were reported which positively (Büyükgoze-Kavas, Duffy, Güneri & Autin, 2014; Cerit, 2014; Gümüş, Hamarat, Çolak & Duran, 2012; Demirtaş & Alanoğlu, 2015; Mamatoğlu, 2008; Yılmaz & Izgar, 2009), or negatively predicted teachers' job satisfaction (Karakuş & Çankaya, 2012; Ökçü & Çetin, 2017; Tabancalı, 2016).

Perceived support, respect to ideas and values:

Demirtaş and Alanoğlu (2015) demonstrated that teachers' participation to instructional and administrative decisions at school positively predicted their job satisfaction. Similarly, Yılmaz and Izgar (2009) showed that teachers' job satisfaction was positively predicted by organisational creativity environment that highlighted the climate towards different ideas, supporting individual efforts, acting uniquely and being innovative. Besides, they also found that teachers' job satisfaction increased with the administrative support perceived by them. Cerit (2014) reported that the perception of collectivism that encourage solidarity and support positively predicted job satisfaction.

Caring about ideas and individual values:

Büyükgoze-Kavas, Duffy, Güneri and Autin (2014) determined that teachers' job satisfaction was positively predicted by their having a workplace environment in which they are valued. Furthermore, they also revealed that the integration with organisational values positively predicted job satisfaction. Gümüş, Hamarat, Çolak and Duran (2012) reported that identification with school and professional identification positively predicted job satisfaction, and Mamatoğlu (2008) also showed that identification with other teachers positively predicted satisfaction.

Psychological mobbing:

Various organisational characteristics negatively predicted job satisfaction. Karakuş and Çankaya (2012) reported that the psychological violence teachers are exposed to negatively predicted their job satisfaction. Likewise, Ökçü and Çetin (2017) observed that intimidation towards the job and intimidation towards relationships negatively predicted job satisfaction. On the other hand, Tabancalı (2016) indicated that loneliness negative predicted intrinsic and extrinsic job satisfaction in environments where teachers' social relationships at a low level. Lastly, Karakuş and Çankaya (2012) found that as teachers' have increased feelings of incompetence, failure and insensitivity in their profession, their burnout negatively predicted their job satisfaction.

4. Results and discussion

In this study, 27 empirical studies on teachers' job satisfaction were examined. In these empirical studies, there were three factors that predicted job satisfaction. These were school administrators' administrative behaviours, individual variables and organisational variables. When the three factors are evaluated together, it can be stated that personal relationships at school and teachers' individual competence perceptions and being psychologically healthy were important in ensuring their job satisfaction.

Certain characteristics contributed to teachers' job satisfaction. These characteristics were ensuring collaboration and creating team spirit at school, culture of trust, and school principals' sustaining communication and interaction with teachers. On the other hand, social support, psychological support or meeting different needs, and strong emphatic relationships were decisive in ensuring job satisfaction. Besides, teachers' professional self-efficacy beliefs, positive attitudes towards life and being psychologically healthy were individual variables that
explained job satisfaction. In parallel to the findings in this study, Utriainen and Kyngas (2009) formed three themes including interpersonal relationships, patient care and organising nursing tasks in their study in which they compiled articles on nursery. The theme 'interpersonal relationships' consisted of sub-themes such as the feeling of synergy, interaction and communication, team work, organisational climate and peer support. The theme 'patient care' contained sub-themes including the importance of patient care, opportunities for quality patient care and good relationships with patients. Lastly, the theme 'organising nursing duties' was formed with sub-themes such as work-family relations, supportive leadership, workplace, appropriate workload, salary and benefits, autonomy, professionalism and professional development.

In accordance with the research findings, Lu, While and Barriball (2005) found in their review of studies related to nurses' job satisfaction that work stress rather than working conditions affected job satisfaction. Moreover, they reported that nurses' work load increased their work stress, which weakened job commitment and relationships. Taylor and Tashakkori (1995) determined school culture and participation to decision-making processes as antecedents of job satisfaction. Crossman and Harris (2006) stated that the environmental factors forming job characteristics and workplace environment affected job satisfaction. In a similar vein, Brief and Weiss (2002) indicated that when individuals have more intense relationships with their environment, they exhibit positive personality characteristics, and when they work in supportive environments, they have higher job satisfaction.

In studies on job satisfaction, it is emphasized that the concept is composed of intrinsic and extrinsic factors. Intrinsic factors cover elements such as personality, education, talent, age and marital status, while extrinsic factors include those such as wage, promotion opportunities, colleagues and supervision (Spector, 1997). According to Hackman and Oldham (1976), the variety of tasks in the organisation, the identity and importance of positions, autonomy for employees and feedback facilitate job satisfaction. Spector (1997) asserted that the variety of skills and tasks, importance of tasks, job autonomy and feedback towards the job were among the determinants of job satisfaction. Luthans (2010) said that the primary determinants of job satisfaction were the job, wage, promotion, supervision and colleagues. Tella, Ayeni and Popoola (2007) pointed out that job characteristics, interests, status, security and promotion opportunities affected job satisfaction. For Kreitner and Kinicki (1998), meeting individual needs, disagreements, values gained, equality and quality were among the decisive characteristics behind job satisfaction.

As can be inferred from the a fore mentioned statements, the elements that ensure job satisfaction mostly include job characteristics, success, recognition, working conditions and interpersonal relationships according to the findings in this study. These results are consistent with Herzberg’s (1959) dual-factor motivation theory. On the other hand, job satisfaction can be said to develop depending on school-based factors and teachers' intrinsic rewards. Skaalvik and Skaalvik's (2011) study also support these results. They showed that strong relationships and a supportive environment at school were important in promoting job satisfaction.

According to the findings in this study, the following suggestions can be offered for practitioners: School administrators who want to enhance teachers' job satisfaction can be suggested to exhibit integrative and sincere behaviours and create a strong collaboration environment and support culture at school. Besides, administrators can support the improvement of teachers' professional self-efficacy beliefs. Furthermore, teachers' job satisfaction can be strengthened by supporting them psychologically when needed and forming a proper school culture. In this respect, school administrators can be suggested to create a strong school culture based on trust, justice and support as they care about communication, interaction
and helpfulness in their schools. Moreover, teachers should receive counselling services towards improving their individual psychological determinants. Policy-makers, on the other hand, can improve the working conditions and thus make school principals pay more attention to teachers. This is because school principals' being too busy with the bureaucratic routines or daily tasks can hinder the communication with teachers and forming a healthy working environment. As for further research, the studies examined in the present study are limited to a certain number of papers. The study can be replicated by including theses/dissertation and in the international literature. The studies that examined the effects of administrative behaviours, organisational variables and individual variables on job satisfaction mostly adopted quantitative survey and relational models. Therefore, descriptive qualitative studies and causal studies can be conducted to reveal the cause-effect relationship in-between. Additionally, the relationships between two variables were investigated in most relational studies on job satisfaction. In this regard, many other variables can be studied. Mediator and moderator variables can also be included in such studies.
